

Foreign Exchange - Currency Conversion

The Mojaloop currency conversion functionality enables foreign exchange (FX) transactions, supporting multiple approaches for currency conversion within the ecosystem. Currently, the system implements **Payer DFSP currency conversion**, where the Payer DFSP (Digital Financial Services Provider) coordinates with a foreign exchange provider (FXP) to obtain liquidity in another currency to facilitate a transfer.

Future enhancements to the currency conversion design include:

1. **Payee DFSP conversion**

The Payee DFSP arranges for foreign exchange conversion.

2. **Reference currency conversion**

Both the Payer and Payee DFSPs engage with FXPs to convert funds via a reference currency.

3. **Bulk conversion**

DFSPs can procure currency liquidity from an FXP in bulk.

Role of the Foreign Exchange Provider (FXP)

A core feature of Mojaloop's currency conversion capability is its support for a competitive FX marketplace, where multiple FXPs can provide real-time exchange rate quotes. This design fosters an open and dynamic environment for foreign exchange transactions.

The currency conversion process follows a three-step workflow:

1. **Quote Request**

The Payer DFSP requests a quote from an FXP. For example, a Zambian DFSP can obtain a conversion quote for a specific transfer.

2. **Quote Agreement**

The Payer DFSP reviews the exchange rate and terms provided by the FXP. Once accepted, the FXP locks in the rate.

3. **Transfer Finalization**

Upon notification from the Mojaloop scheme that the dependent transfer has been completed, the conversion process is finalized.

This streamlined approach ensures transparency and competitiveness in FX transactions, benefiting both DFSPs and end users.

Impact of Amount Type on Currency Conversion

The Payer DFSP conversion implementation supports two distinct scenarios based on the amount type specified in the transaction:

1. **Sending funds in the source (local) currency**

2. **Making a payment in target (a foreign) currency**

Sending Funds to an Account in Another Currency

In this use case, the **Payer DFSP** initiates a transfer using the amount type **SEND**, specifying the transfer amount in the payer's local currency (source currency). This method is commonly used for **P2P remittance**

transfers, where the sender transfers funds in their local currency, and the recipient receives the equivalent amount in their respective currency after conversion.

Currency Conversion Transfer (source currency)

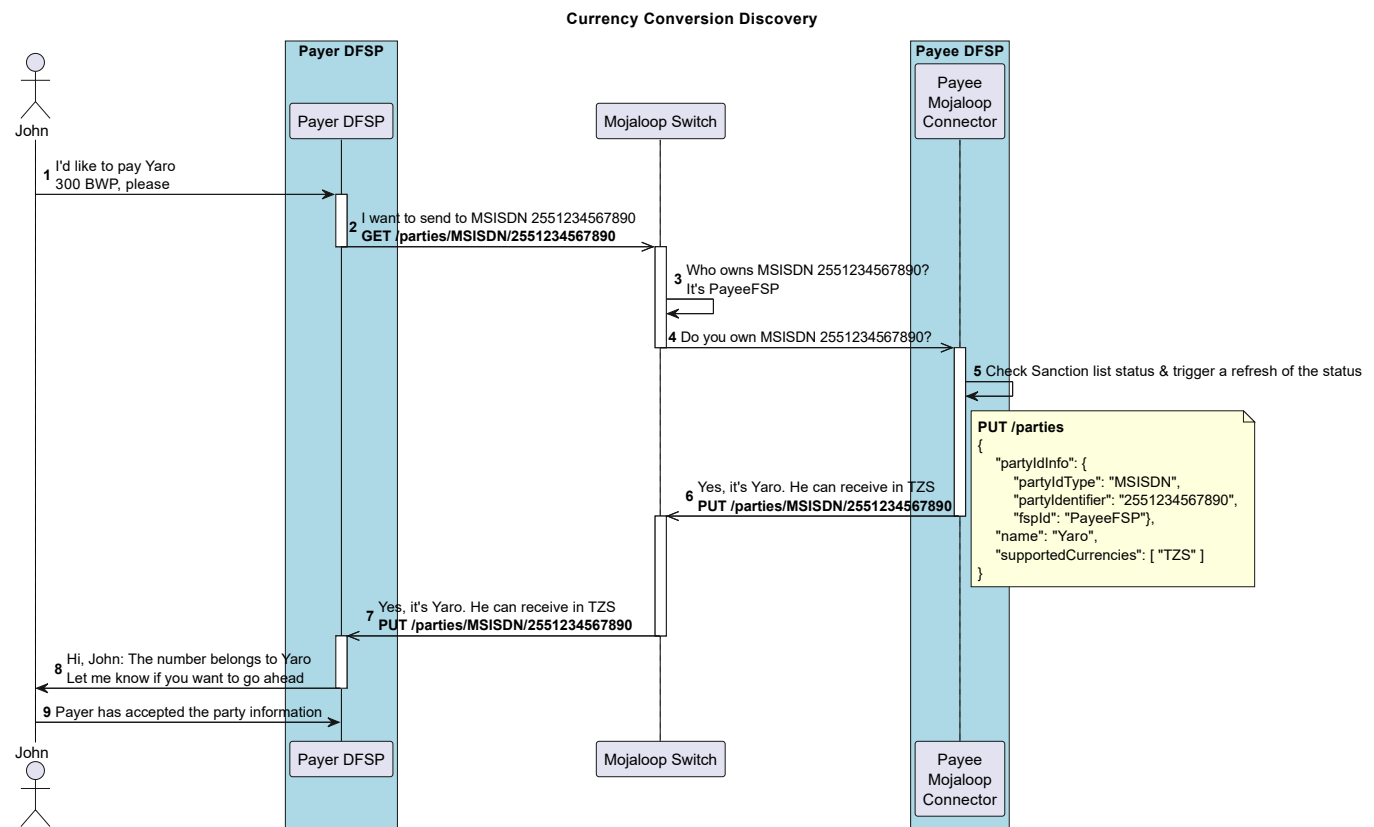

Below is a simplified sequence diagram showing the flows between the Participant organizations, the foreign exchange providers and the Mojaloop switch for a currency conversion transfer specified in source currency.

The flow is divided up into:

1. [Discovery Phase](#)
2. [Agreement Phase - Currency Conversion](#)
3. [Agreement Phase](#)
4. [Payer DFSP presents terms to Payee](#)
5. [Transfer Phase](#)

Discovery Phase

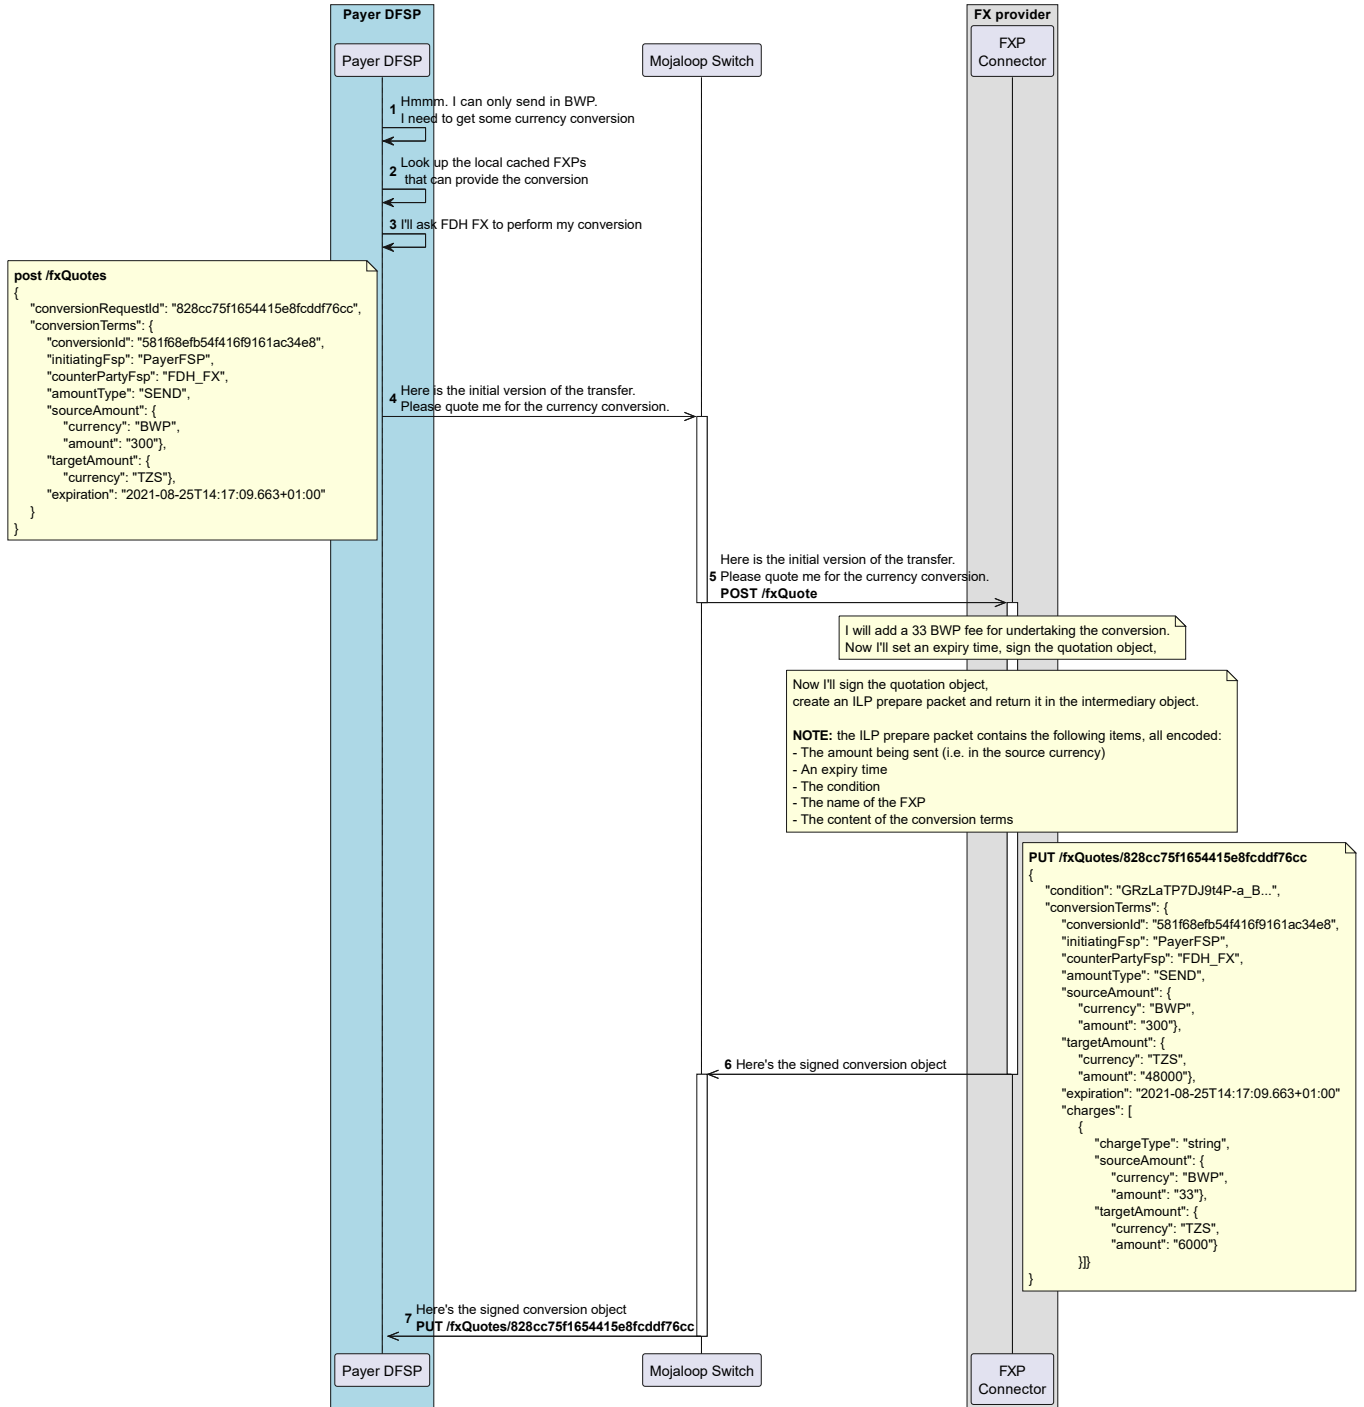

The Payer DFSP identifies the Payee DFSP organization and confirms the account validity and currency.

Agreement Phase - Currency Conversion

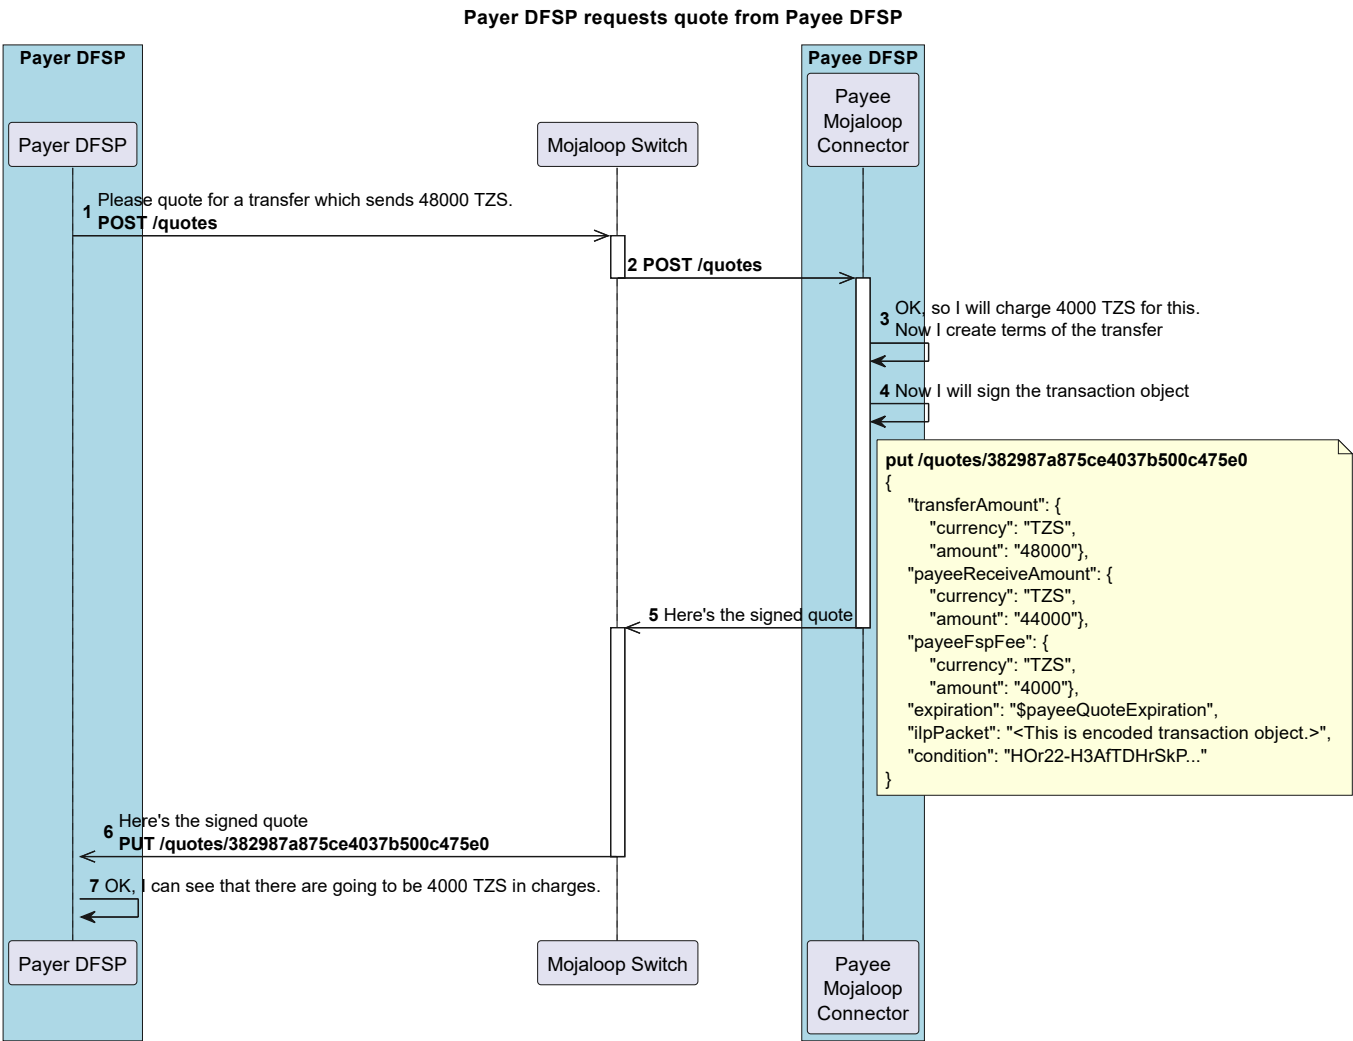

The Payer DFSP makes a request to the FXP for liquidity cover for transfer. The currency conversion terms are returned.

Payer DFSP requests conversion with SEND amount

Agreement Phase

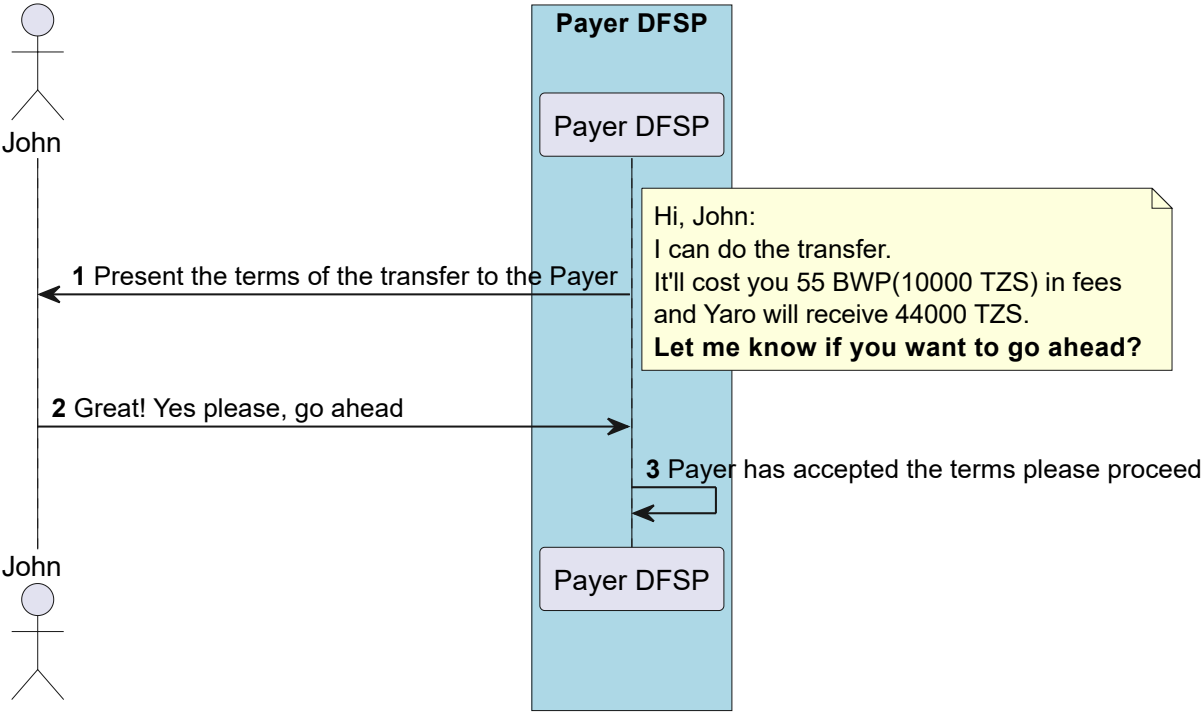

The Payer DFSP makes a request to the Payee DFSP for the transfer terms.

Payer DFSP presents terms to Payer

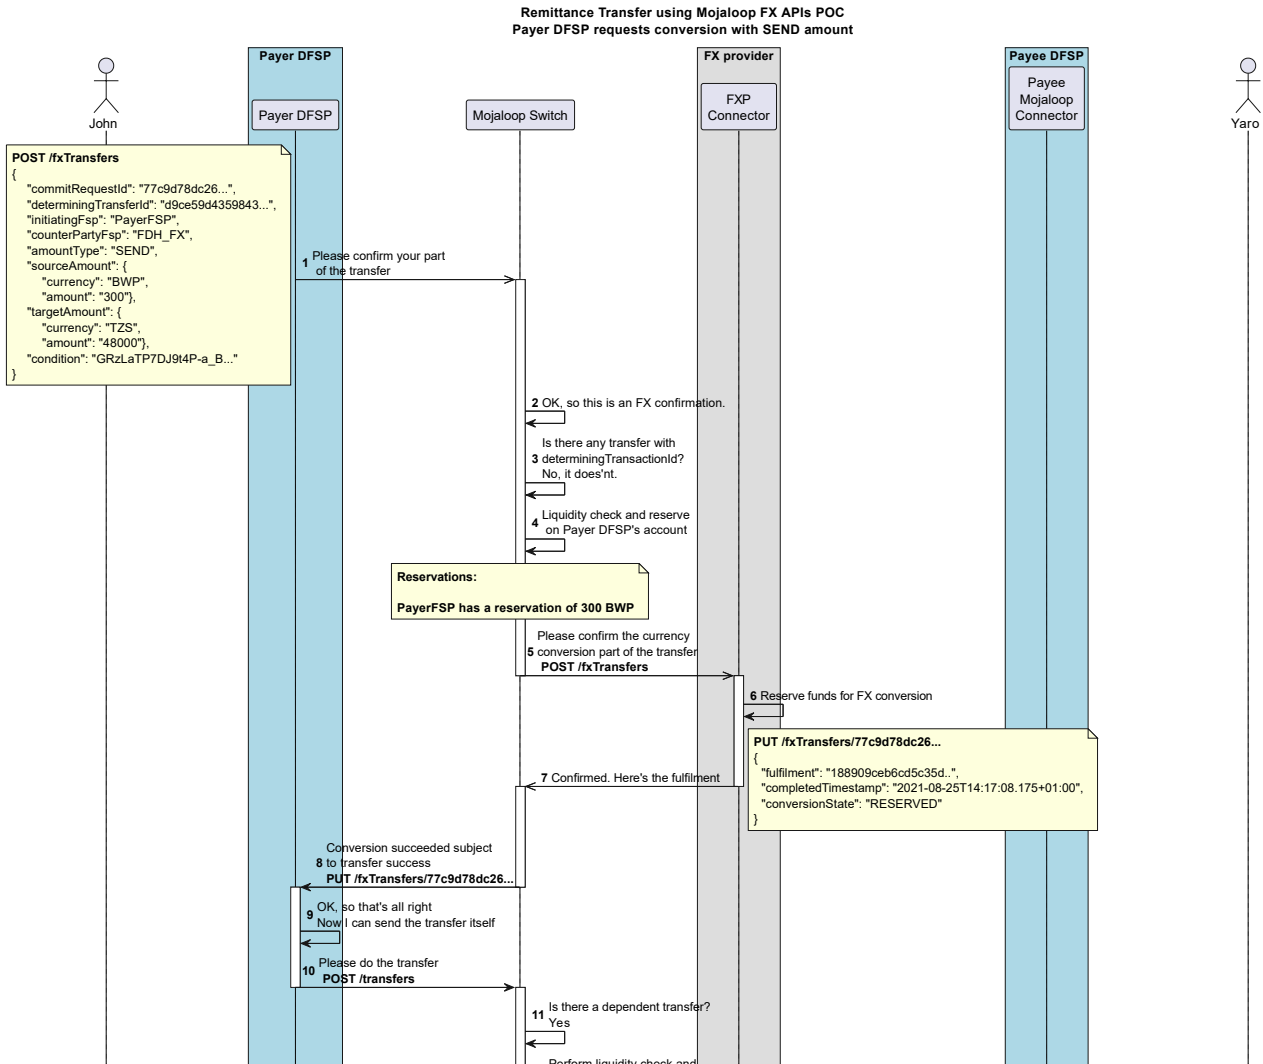

At this point the party information, the conversion terms, and the transfer terms have been provided to the Payer DFSP. The Payer DFSP presents these terms to the Payer and asks whether to proceed or not.

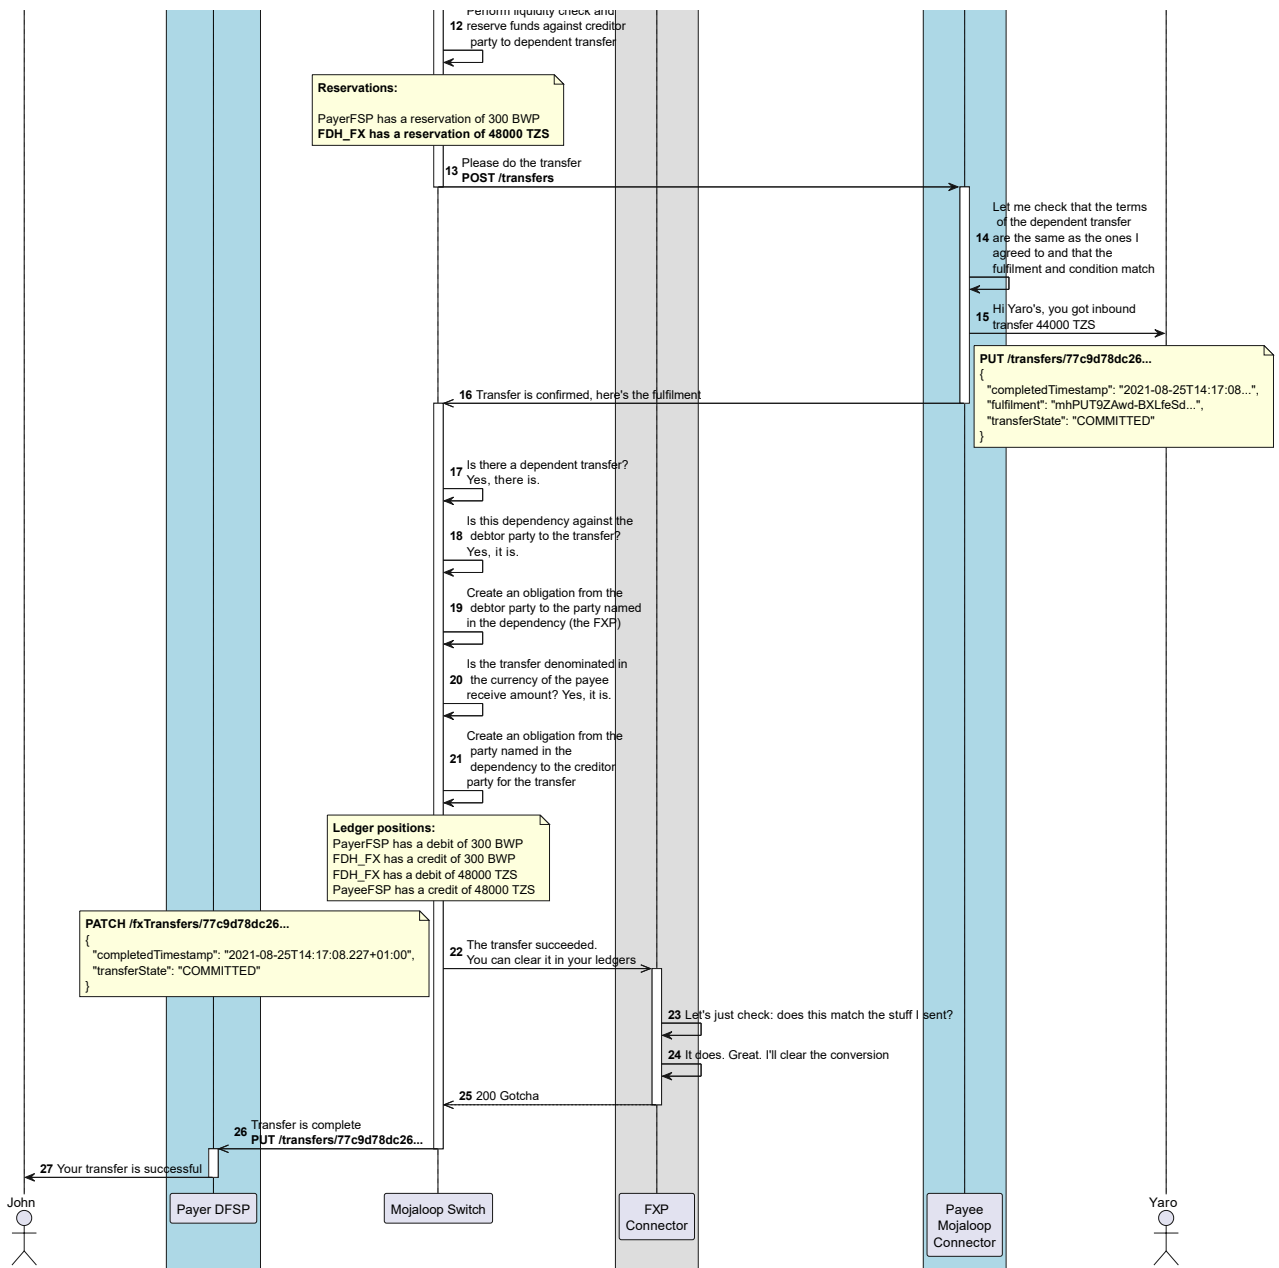

Payer DFSP presents the terms to the Payer

Transfer Phase

Now that the terms of the transfer have been agreed to, the transfer can proceed. Both the Conversion and the transfer terms are comitted together.

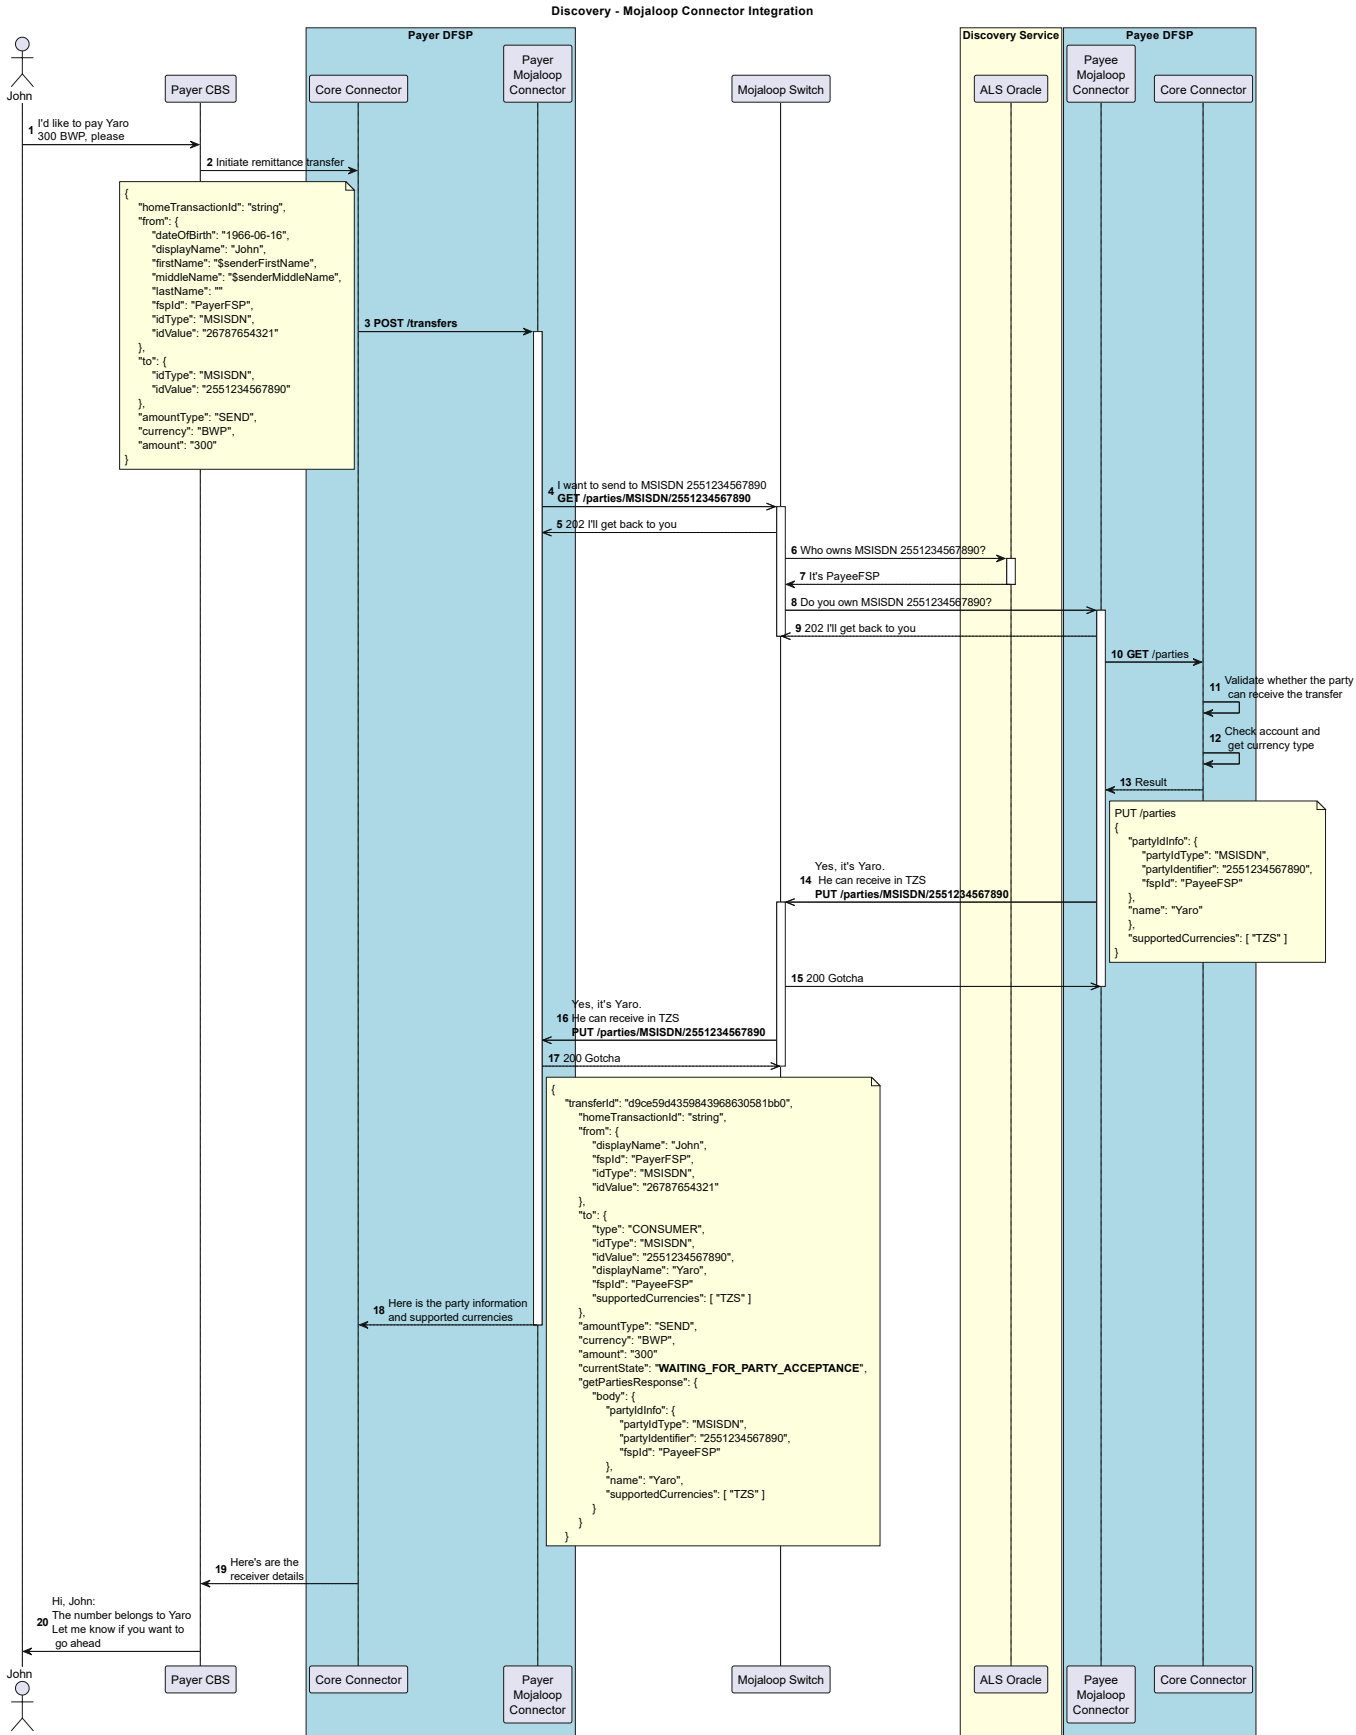

Mojaloop Connector Integration for Currency Conversion

Below is a detailed sequence diagram that shows the complete flow, and includes the **Mojaloop Connector** and integration APIs for all participant organizations. (This is a useful view if you are building integrations as a participant organization.)

Discovery phase - Mojaloop Connector

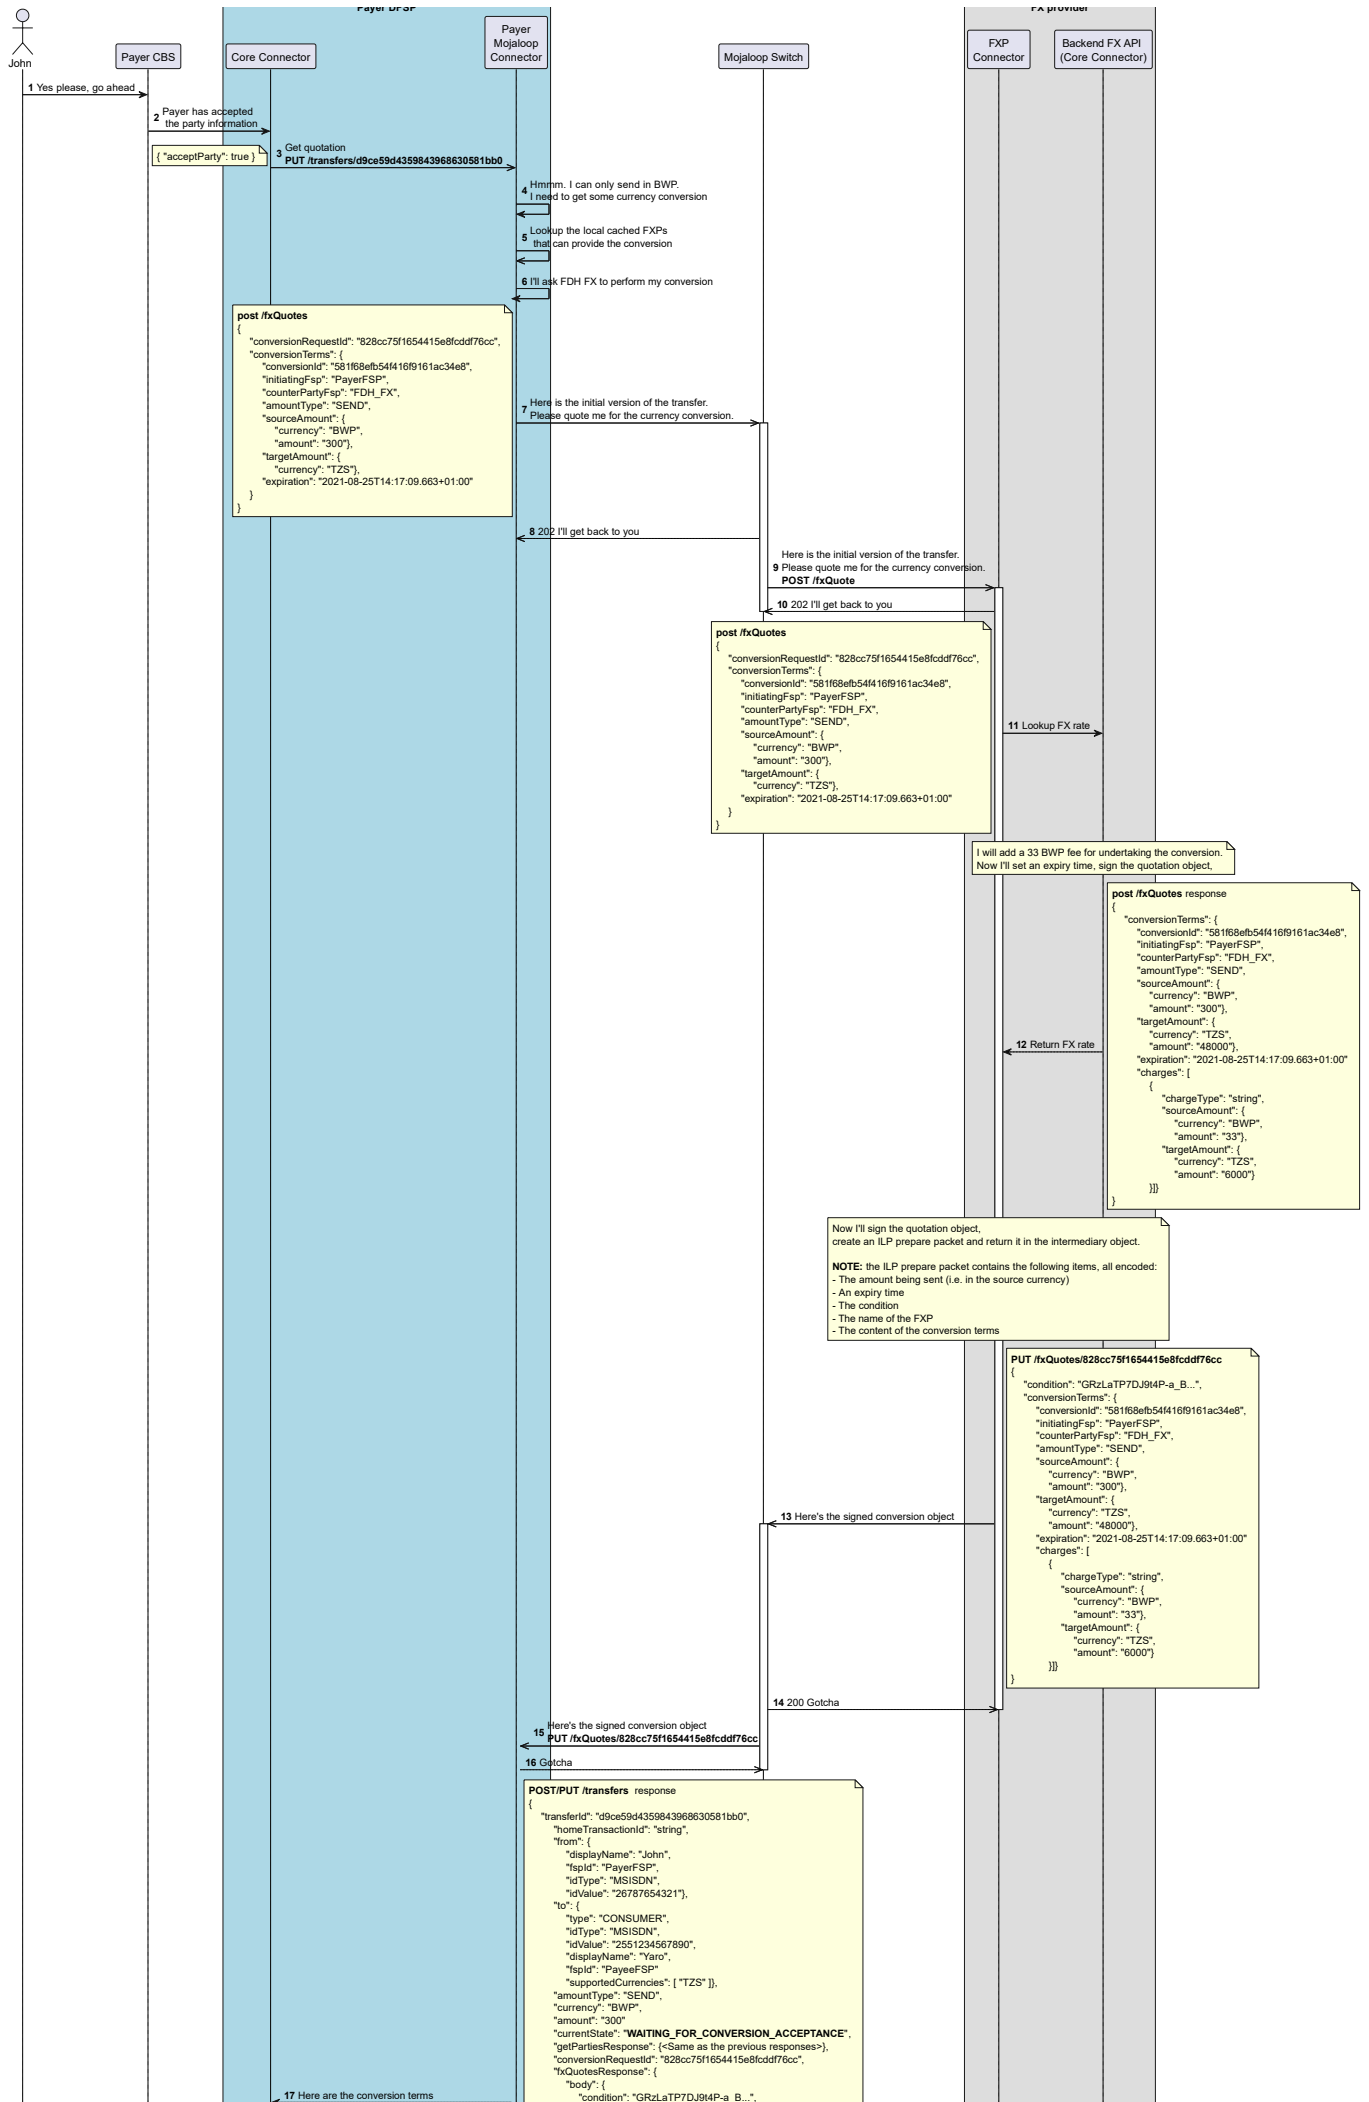

Mojaloop make use of an Oracle to identify the DFSP organization associated with the Party identifier. The Payee DFSP must respond to the GET /parties to confirm that the account exists and is active for that Party

identifier. The supported currencies for that account are returned.

Agreement Phase Currency Conversion - Mojaloop Connector

The Payer DFSP does not transact in any of the Payee DFSPs supported currencies. This triggers the requirement for currency conversion inside the Mojaloop Connector. The Payer DFSP uses it's local cache of FXPs to select and makes a request to the Foreign Exchange provider for liquidity cover and a conversion rate.

Agreement Phase - Mojaloop Connector

Liquidity in target currency has been secured. The Payer DFSP can now proceed to request an agreement of terms from the Payee DFSP. These terms are in target currency.

    Payee_DFSP->>Payee_Mojaloop_Connector: 7 OK, so I will charge 4000 TZS for this. Now I create terms of the transfer
    Note over Payee_DFSP, Payee_Mojaloop_Connector: POST /quoterequests response
    Note over Payee_DFSP, Payee_Mojaloop_Connector: { "quoteId": "382987a875ce403...", "transactionId": "d9ce59d43598439...", "payeeFspFeeAmount": "4000", "payeeFspFeeAmountCurrency": "TZS", "payeeReceiveAmount": "44000", "payeeReceiveAmountCurrency": "TZS", "transferAmount": "48000", "transferAmountCurrency": "TZS", "expiration": "2021-08-25T14:17:09.663+01:00" }
    Payee_DFSP->>Payee_Mojaloop_Connector: 8 Here are the terms
    Payee_DFSP->>Payee_Mojaloop_Connector: 9 Now I will sign the transaction object
    Note over Payee_DFSP, Payee_Mojaloop_Connector: put /quotes/382987a875ce403...
    Note over Payee_DFSP, Payee_Mojaloop_Connector: { "transferAmount": { "currency": "TZS", "amount": "48000", "payeeReceiveAmount": { "currency": "TZS", "amount": "44000", "payeeFspFee": { "currency": "TZS", "amount": "4000", "expiration": "$payeeQuoteExpiration", "ilpPacket": "<This is encoded transaction object.>", "condition": "H0r22-H3A1TDHrSkP..." } } } }
    Payee_Mojaloop_Connector->>Mojaloop_Switch: 10 Here's the signed quote
    Mojaloop_Switch->>Payer_DFSP: 11 200 Gotcha
    Payer_DFSP->>Payer_Mojaloop_Connector: 12 Here's the signed quote  
PUT /quotes/382987a875ce403...
    Payer_Mojaloop_Connector->>Mojaloop_Switch: 13 200 Gotcha
    Payer_DFSP->>Core_Connector_Payer: 14 OK, I can see that there are going to be 4000 TZS in charges.
  
```

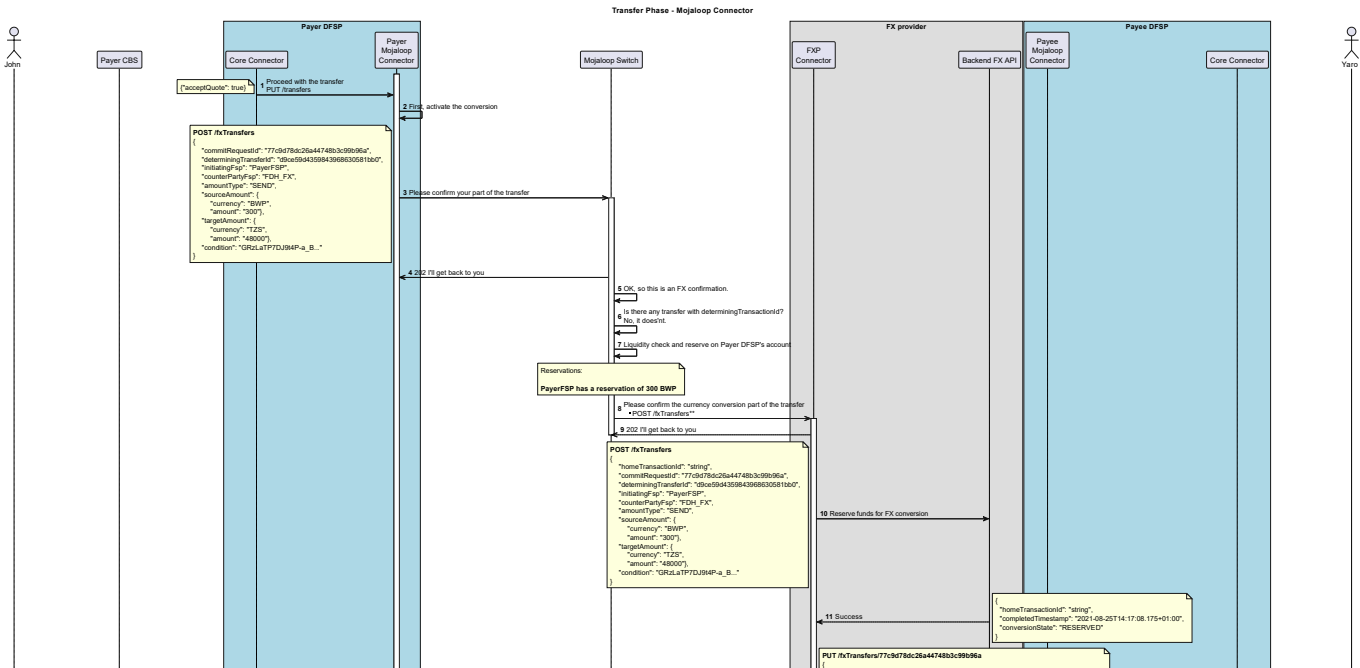

Sender Confirmation

All the terms for the currency conversion and transfer have been obtained by the Payer DFSP and FXP. It is now time to collate those terms and present them to the Payer for confirmation.

Transfer Phase

The terms of the transfer have been accepted. The transfer phase can now commence.

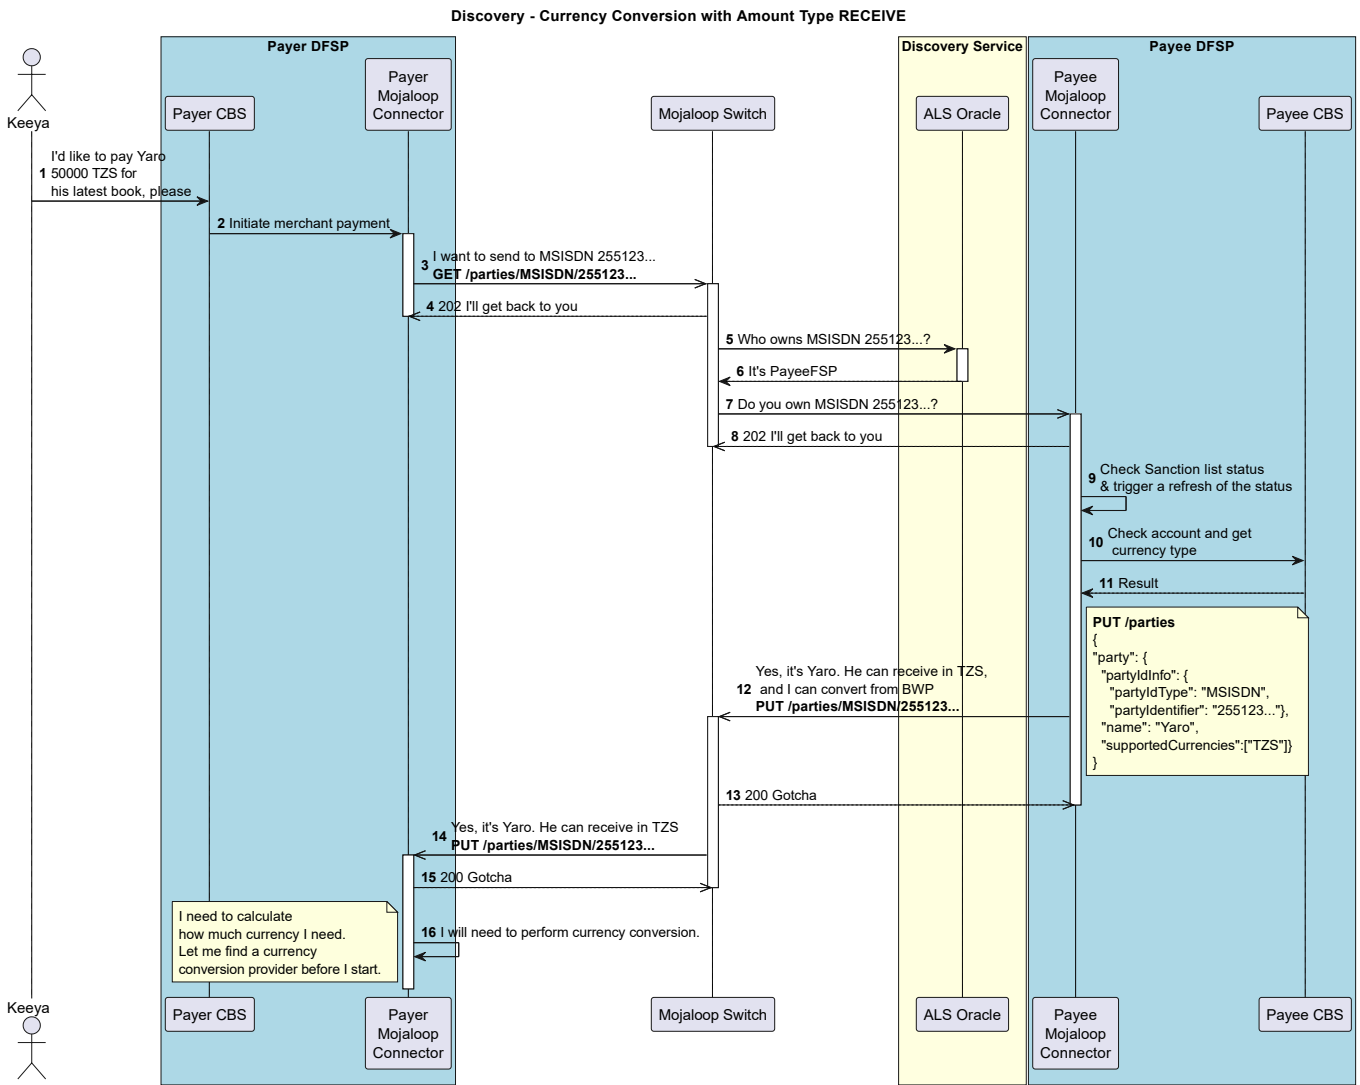

Currency Conversion Transfer (target currency)

For this use case, the Payer DFSP will specify the transfer with amount type **RECEIVE** and define the transfer amount in the **Payee's local currency** (the target currency). An secondary use case example for this is a cross boarder Merchant Payment.

Below is a detailed sequence diagram that shows the complete flow, and includes the Mojaloop connector and integration APIs for all participant organizations.

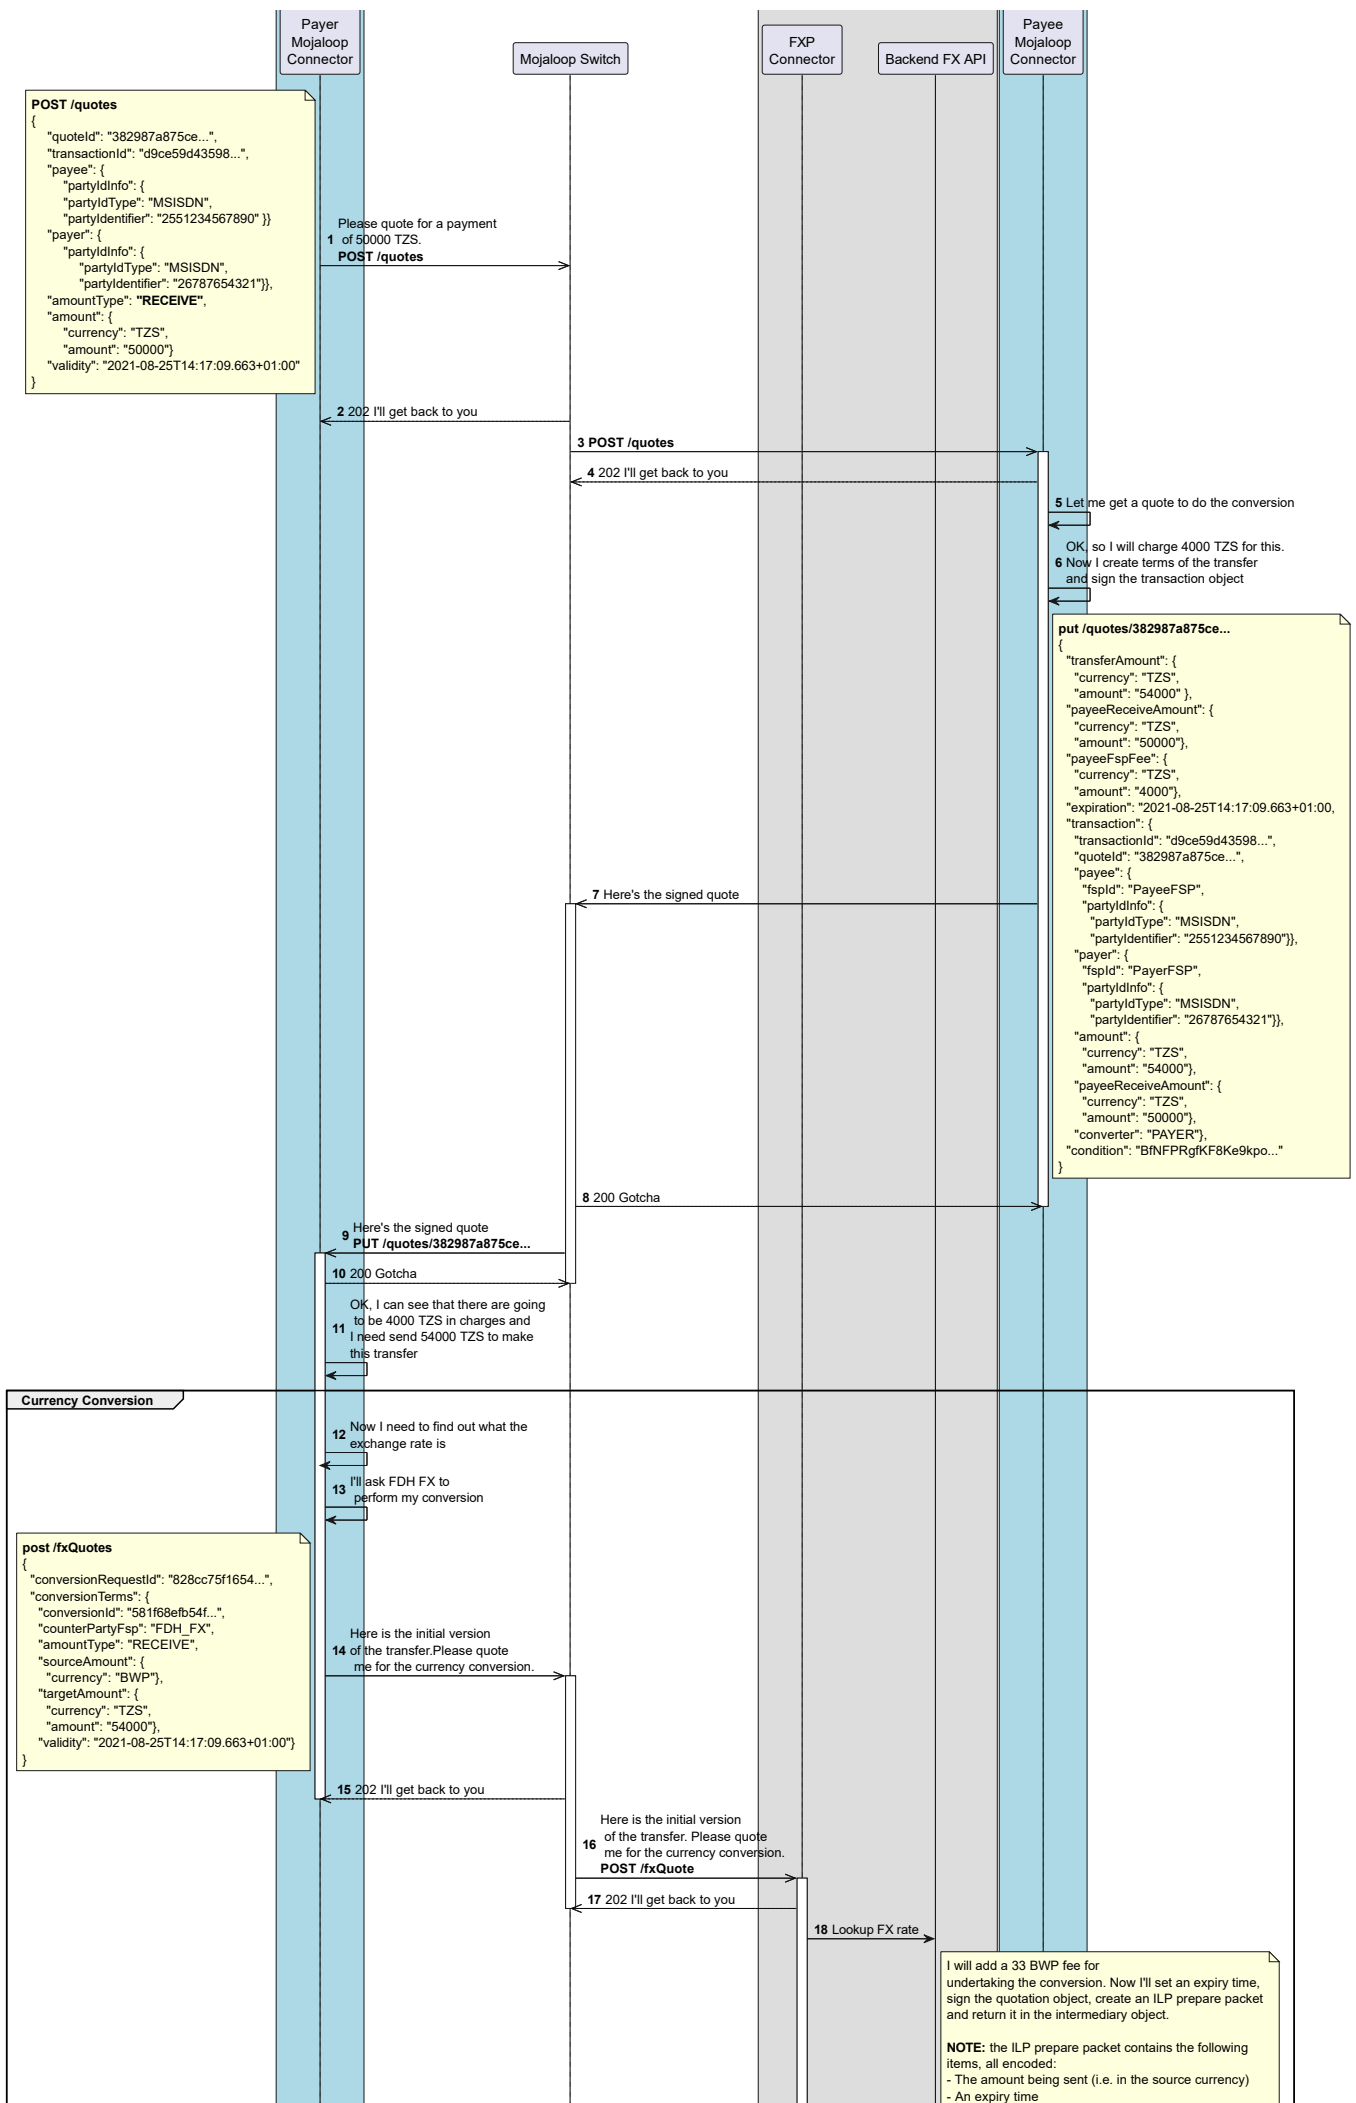

Discovery

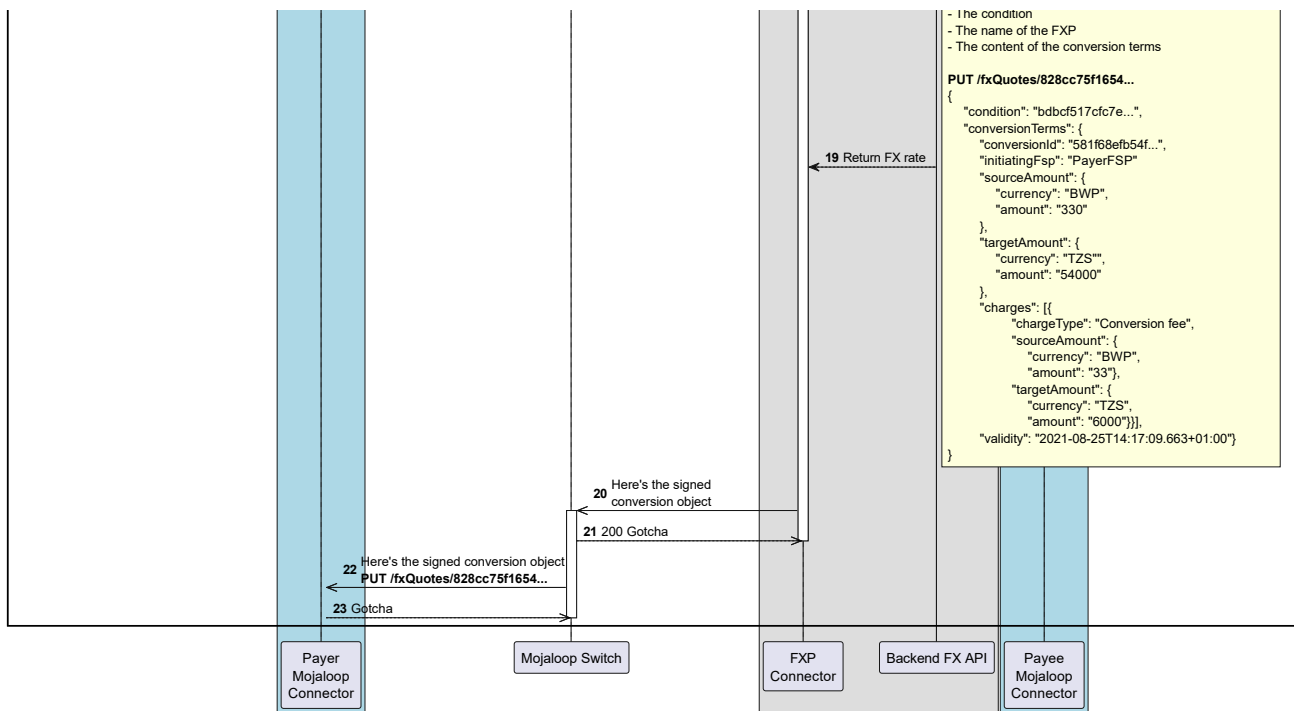

Mojaloop make use of an Oracle to identify the DFSP organization associated with the Party identifier. The Payee DFSP must respond to the GET /parties to confirm that the account exists and is active for that Party identifier. The supported currencies for that account are returned.

Agreement

The Payer DFSP does not support any of the Payee DFSP's currencies, requiring currency conversion within the Mojaloop Connector. Since the payment request is in the target currency, an agreement with the Payee DFSP must be established before initiating a liquidity request with the foreign exchange provider. The Payer DFSP first negotiates the transfer terms with the Payee DFSP, then uses its local cache of foreign exchange providers to select one and request liquidity coverage and a conversion rate.

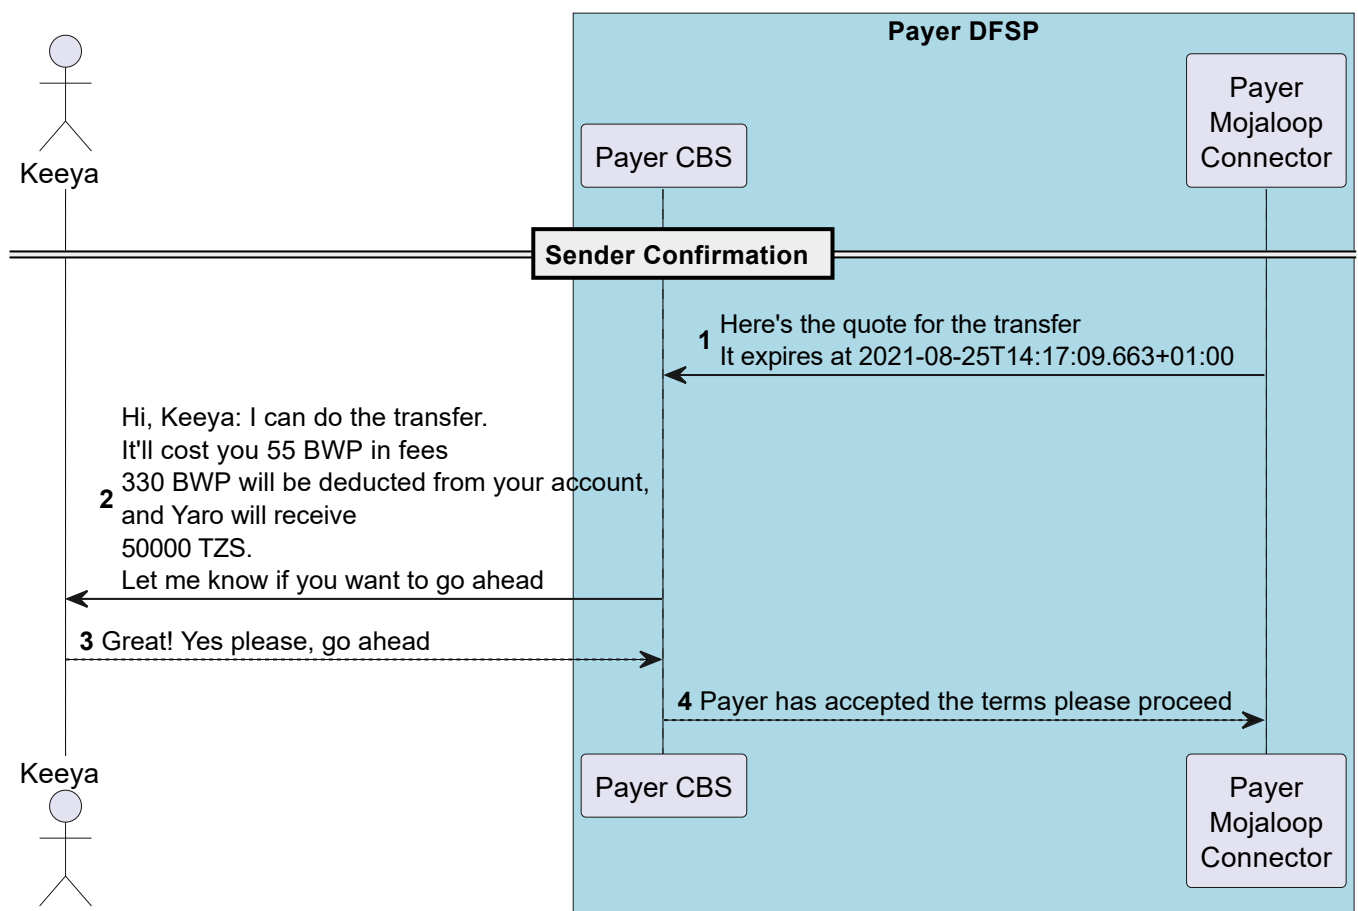

Sender Confirmation

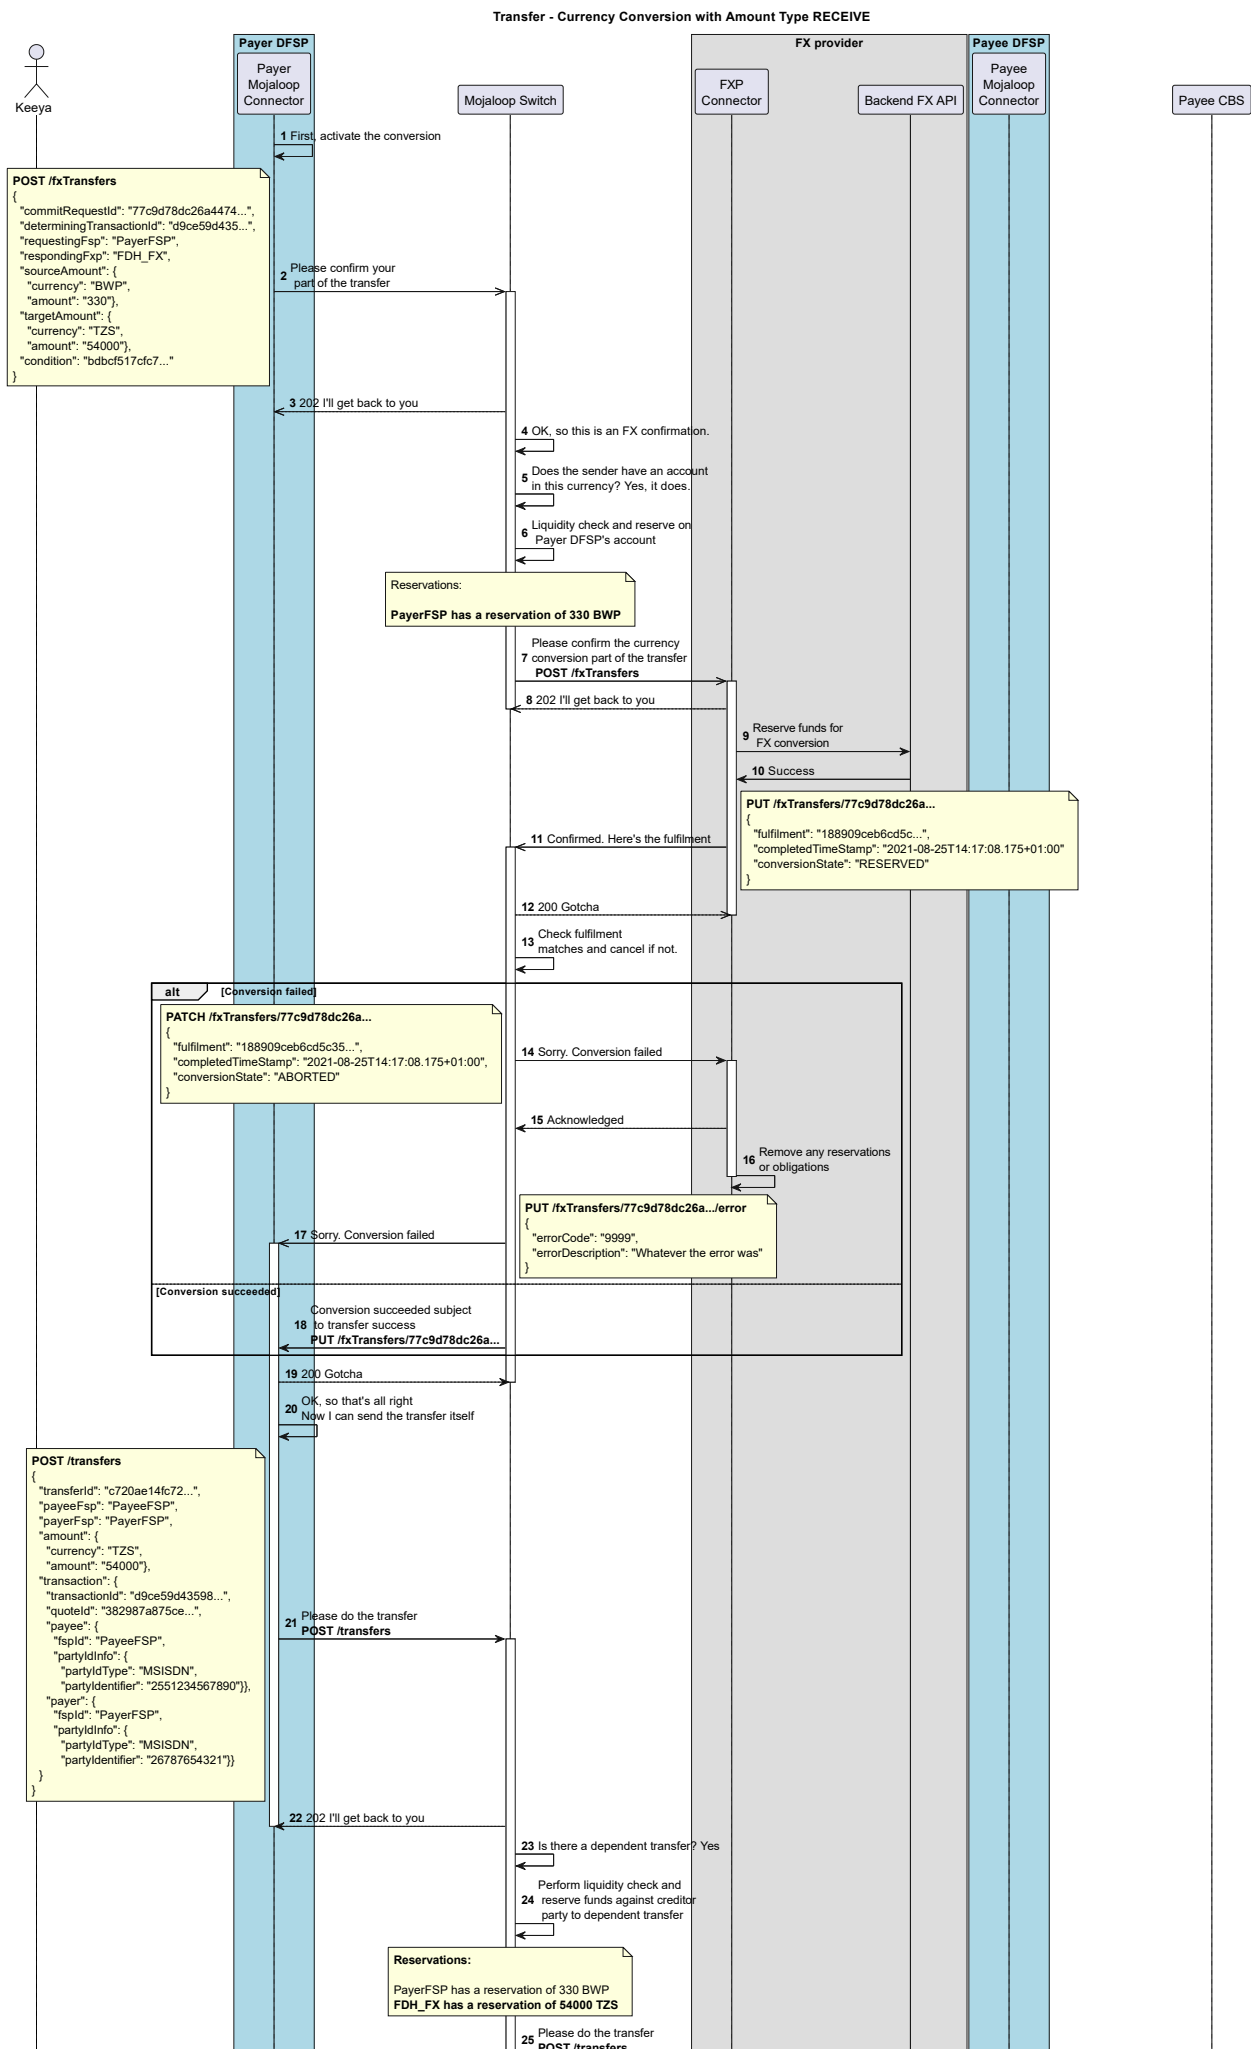

All the terms for the currency conversion and transfer have been obtained by the Payer DFSP and FXP. It is now time to collate those terms and present them to the Payer for confirmation.

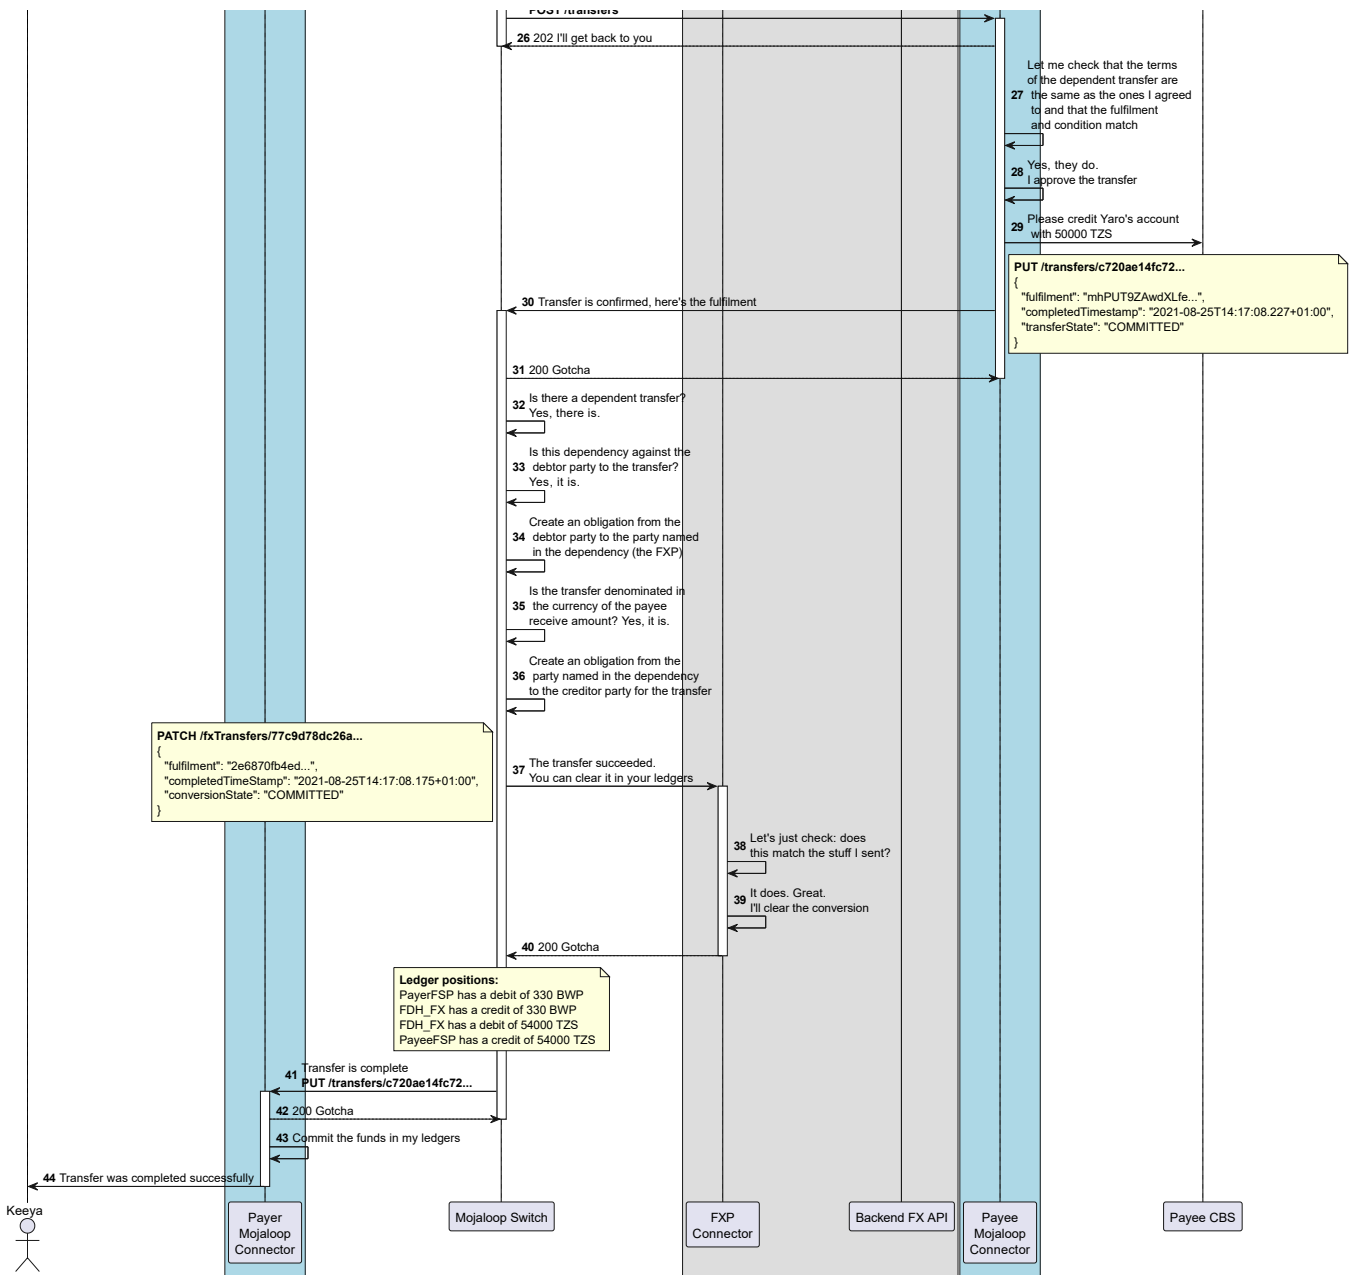

Currency Conversion with Amount Type RECEIVE

Transfer

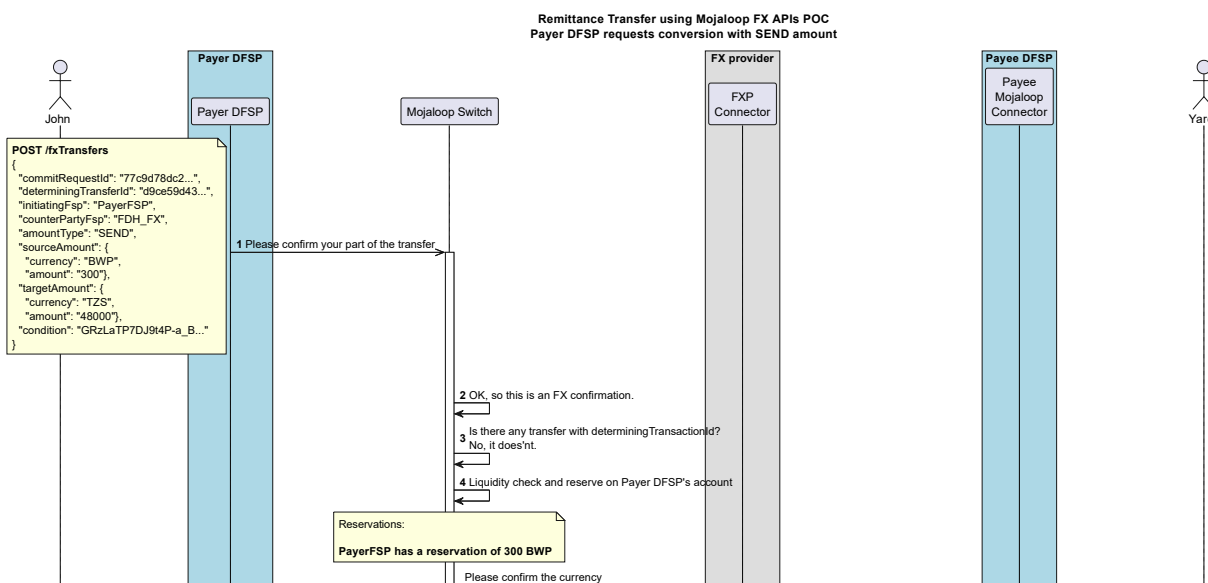

The terms of the transfer have been accepted. The transfer phase can now commence.

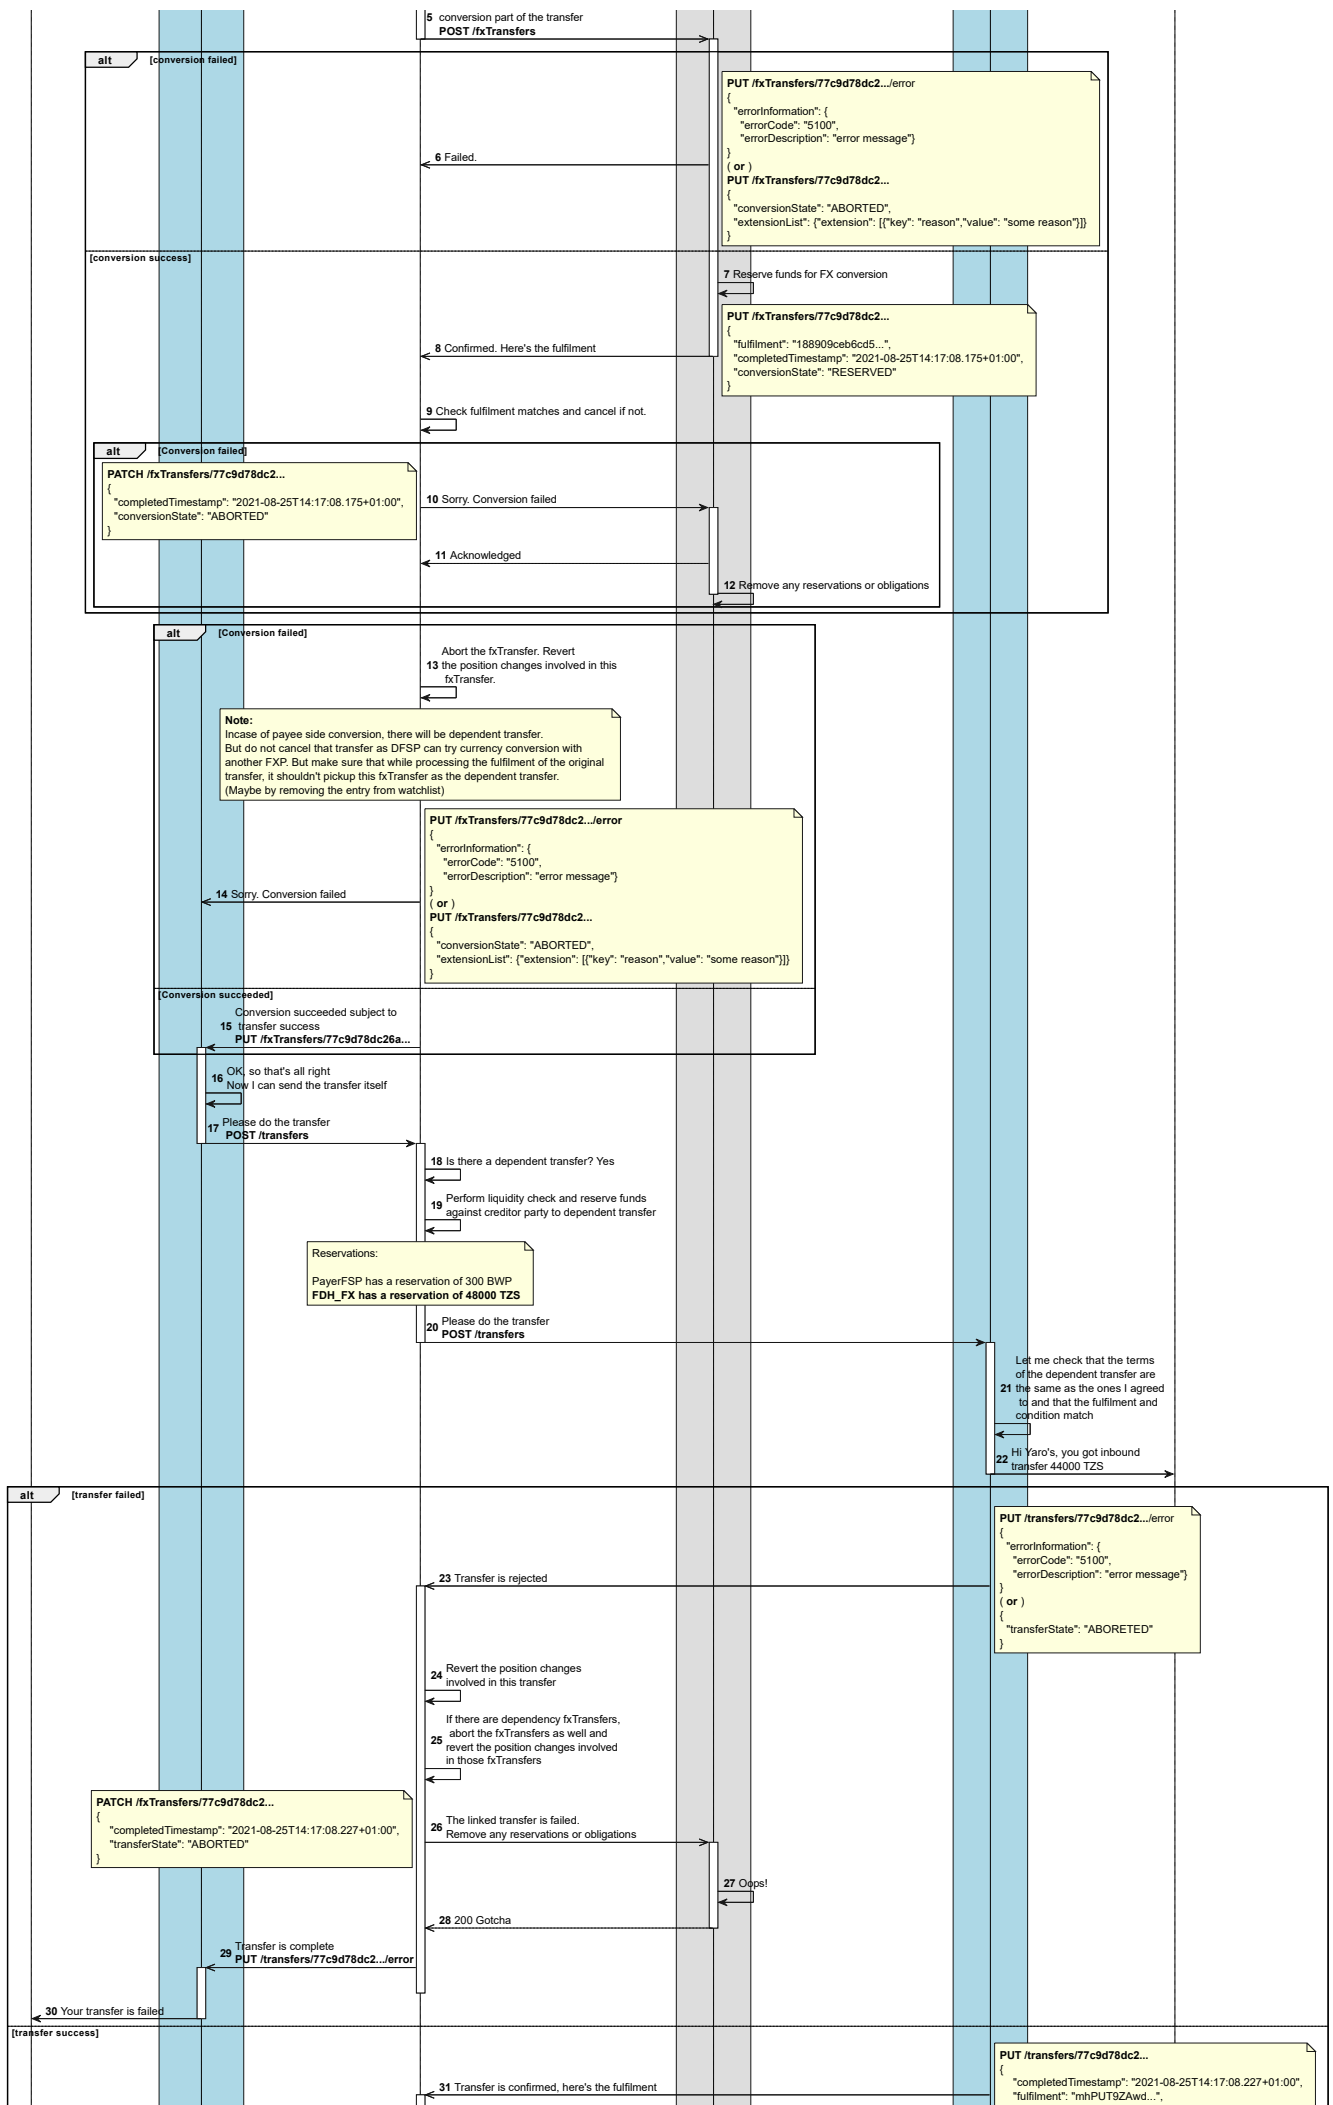

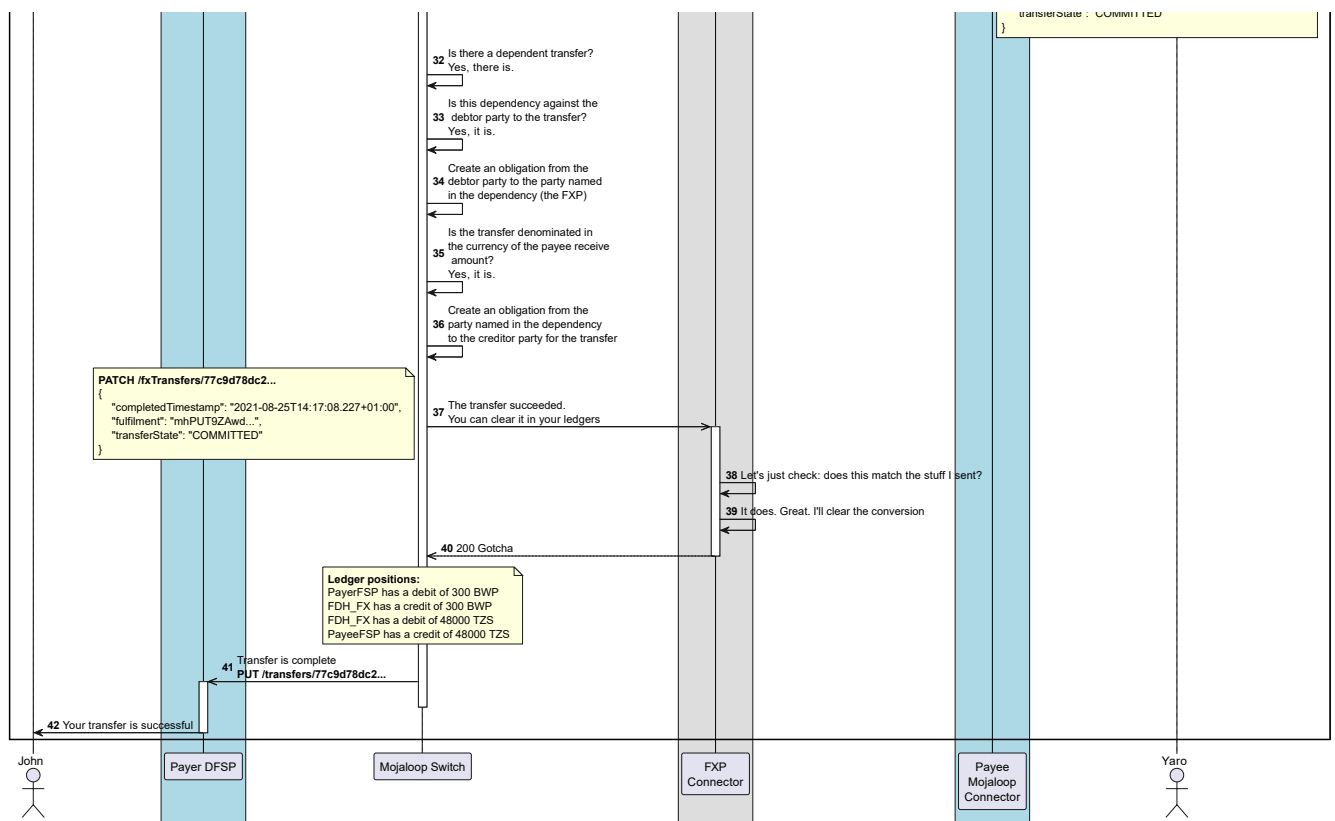

Abort flows

This sequence diagram show how the design implements abort messages during the currency conversion transfer phase.
