Core Connector Testing Harness

The core connector testing harness has got step-by-step instruction as to how it can be downloaded and used.

Github Repository for Core Connector Testing Harness

Testing Harness Intended Use

The testing harness is intended to be used for:

1. Learning the integration APIs
2. Developing core-connectors
3. Running the golden path Core-Connector test collection to validate that the core-connector meets the integration requirements of the scheme.

Customizations to test collection

The testing harness meets a standard generic implementation. It may be necessary to customize the test collection in order to adjust for non-standard APIs. The standard collection includes all required fields, so this adjustment may just be a mere reorganization of the message payload.
